

Kodiak Yukon Gold Property

The Kodiak Gold property in the Yukon, optioned in 2009 from Ryanwood Exploration boasts tremendous upside, and has tie-on claims on the south side of Kinross's (Underworld) White Gold Property.

Location

The Kodiak Property consists of 152 Yukon Quartz Mining claims covering an area of approximately 6,400 acres in the Dawson Mining District between the placer drainages of Thistle and Kirkman Creeks approximately 115 km south of Dawson City, YT.

Property History

The Kodiak claim block straddles Thistle creek which was the richest placer gold-producing creek in the area giving up more than 63,000 ounces of placer gold since the turn of the century. Ryanwood Exploration was also the vendor for Underworld's White Property and has re-evaluated the Geological Survey of Canada Database for similar positive indicators for white style mineralization. The GSC airborne magnetic data indicate the Kodiak claims are sitting on the same regional north — south magnetic high anomaly that Underworld's white gold property is now covering. The GSC silt survey of the Thistle area indicates a 90-per-cent percentile gold anomaly, a 98-per-cent percentile arsenic anomaly and up to 99-per-cent percentile silver anomaly all draining from the Kodiak property. Again, all positive indicator elements in white-gold-style mineralization. A third piece of data that increases the Kodiak potential is the GSC map which has noted a northwest and northeast trending regional structure and the same geological units were mapped by the GSC on both the White and Kodiak properties which consist of DMA amphibolites, DMogt orthogneiss, and DMps quartz mica schist.

There has been insufficient exploration to define a mineral resource on the Kodiak property, and it is uncertain as to whether, or not, further exploration will result in the discovery of a mineral resource on the property. We seek Safe Harbor.

KODIAK PROPERTY HIGHLIGHTS

- Tie-on Claims to Kinross (Underworld) White Gold Property
- Kodiak anomalies are at the end of a high magnetic trend that extends from Underworld White property
- Potential mineralization further supported by historical placer gold production on Thistle Creek bounding north side of claim block, and anomalous silt (stream) sediment values on Kodiak from GSC surveys.

2009 Soil Sampling Results

In the fall of 2009 a total of 1,925 soil samples were collected on a grid covering 875 hectares or 2,163 acres, about 28 per cent of the Kodiak claim block at 50-metre intervals along north-south lines, 100 metres apart. Two anomalous areas of interest were identified. With background gold of 2.5 parts per billion (ppb) over the sample grid, a large contiguous area on the western side of the grid carries greater than four parts per billion gold with accompanying elevated values of arsenic and antimony. This anomalous area is 2,000 metres long and from 100 metres to 750 metres wide. Within this broad area, a cluster of higher gold grades range from 14 ppb to 99 ppb with arsenic from 40 to 676 parts per million and antimony from one part per million to 6.9 ppm. Another cluster of samples (250m X

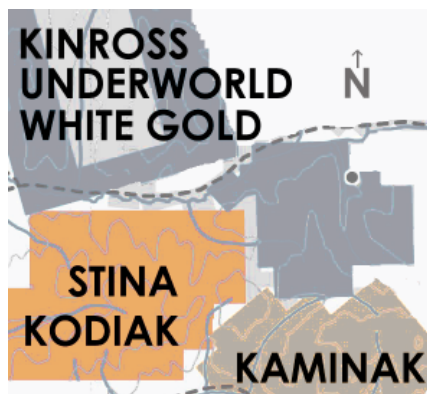

250m) located just outside of the elevated gold area carries gold values ranging from 140 ppb to 308 ppb. This anomaly is unique in that there are no elevated arsenic values. On the eastern side of the grid lays a group of more isolated pockets of elevated gold values also with accompanying arsenic and antimony. Elevated nickel values in soil also occur either with or in the proximity of the anomalous gold zones indicating underlying mafic or ultramafic rocks. Airborne and ground magnetic surveys also support the presence of these rocks on the Kodiak property as well as their existence about 15 km north on the Kinross (Underworld) White gold property. In addition, the soil survey results are significant for the element associations, the pattern of their distribution and for revealing geologic similarities on the Kodiak property with Kinross (Underworld) White gold deposits located about 15 km north.

2010 Soils & Trenching

In August Stina initiated a trenching program on the Kodiak property. Approximately 435 metres of trenching has been outlined over three trenches, based on soil geochemical anomalies obtained in 2009, where the maximum gold value in the survey was 308.2 parts per billion from a northwesterly trending anomaly, with a less-pronounced northerly trend. Ground Truth Exploration Inc. of Dawson City, Yukon, completed 1,886 soils in 2009 and 2,037 in 2010, for a total of 3,923 samples, covering approximately 60 per cent of the property.

Results from the 2010 soil sampling are currently being received and reviewed. Trench mapping and sampling will follow, with samples processed by Acme Laboratories. News on Kodiak soil sampling and trenching will be announced soon, and drill targets for 2011 will be established on the property.
